## Beijing Housing Prices

Predicting Total Price and Identifying Over- and Underpriced Listings

### **Data Overview**

- 318,851 overservations
- 26 variables
- Challenges: Missingness and translation
  - "DOM" had nearly 50% of observations missing
  - Translation and processing issues with "Floor" variable
- Limitations: Mostly computational

### **Project Objectives**

1. Regression: Create a regression model which can accurately predict a real estate listing's total price, given other information about the listing.

1. Clustering: Create clusters which effectively group listings with similar attributes to identify over- and underpriced listings.

#### Setting a Benchmark: Other Groups' RMSEs

RMSE by Group Predicting Total Price						
Α	<u>B</u>	<u>C</u>	<u>D</u>	<u>E</u>		
124.3104	144.755	136.775	89.822	126.304		

- Many groups used metrics other than RMSE to measure model performance, including RMSLE and score functions from packages in Python.
- Our group opted for RMSE because it is easily recognized and understood.

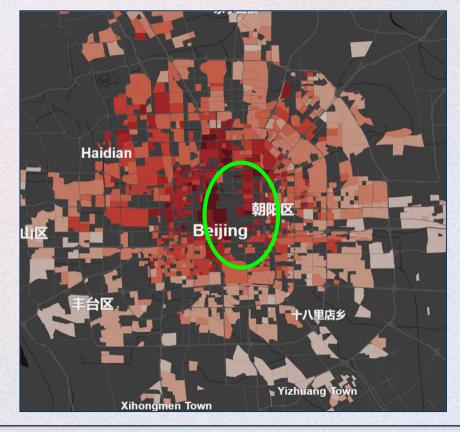

### 39.7 116.2 116.3 116.4 116.5 116.6 116.1 116.7

Map of Beijing with Tiananmen Square, Temple of Heaven, Xin Jiekou, and Beijing International Trade Center (green dots).

### **Literature Review Findings**

Latitude and longitude data fit into Beijing city-blocks using spatial joining. The colors indicate average property price per square meter.

#### **Identifying the Epicenter**

- Examining the images on the previous slide, we noted what appeared to be an epicenter from which the high listing prices radiated.
- Using Google Maps, we were able to identify a landmark in that region: Jingshan Park.
- We found the latitude and longitude for Jingshan Park and used that information to create a "Distance" variable which replaced our longitude and latitude variables with one measurement of how far a listing was from Jingshan Park while accounting for the Earth's curvature.<sup>1</sup>

### HISTOGRAM OF VARIABLES

### VARIABLES CORRELATION HEATMAP

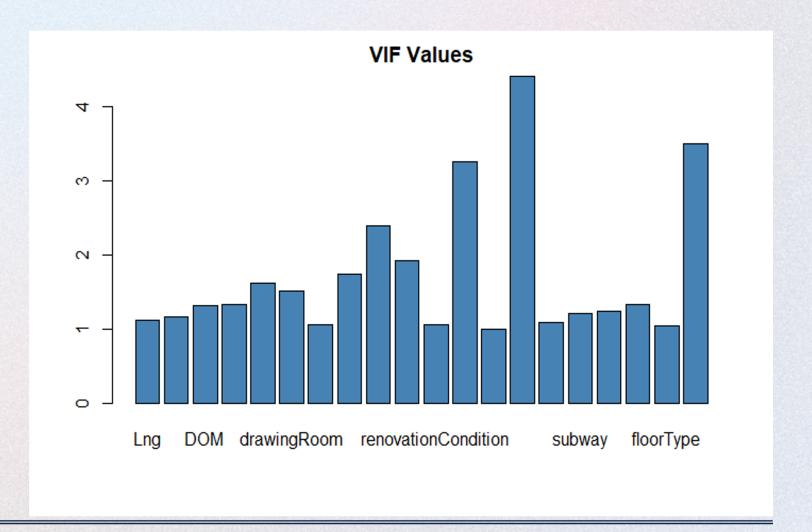

### VIF VALUES

VIF value of floor type = 1.042120

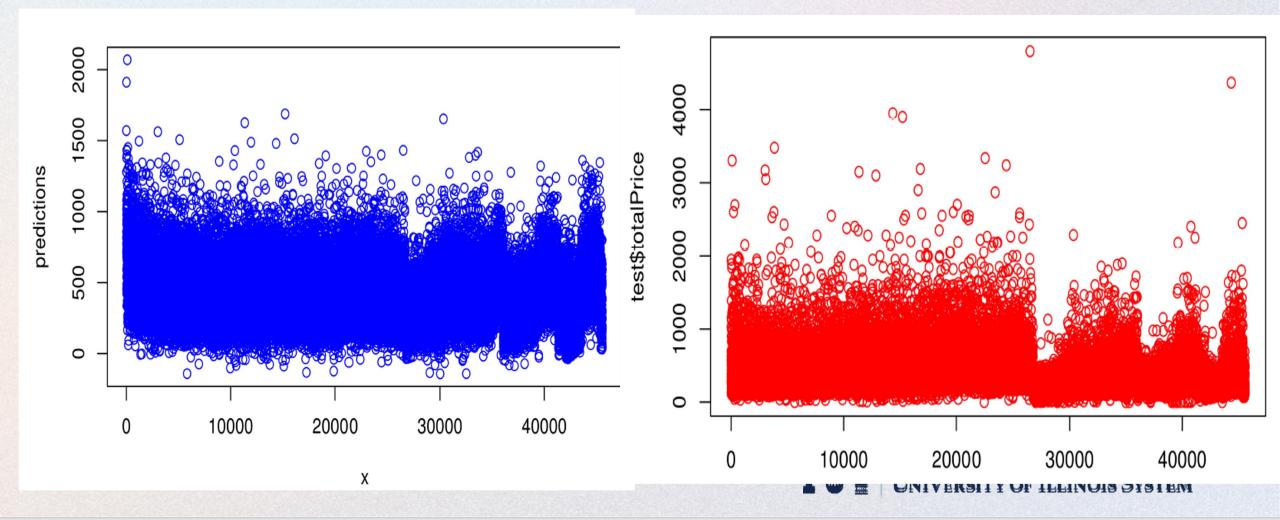

### LINEAR REGRESSION

- A model was selected using the step function and based on the least AIC value (1074655). According to this, Ladder ratio and Longitude were not statistically significant.
- Based on lowest Mallows' Cp using the regsubsets function, the best model was the one that excluded Longitude and Ladder Ratio. (Mallows' Cp: 20.07409)
- Ridge and Lasso regression models were selected using the cv.glmnet function with nfolds = 10.
- The minimum lambda values for ridge and lasso are 0.0083 and 0.0085 respectively.

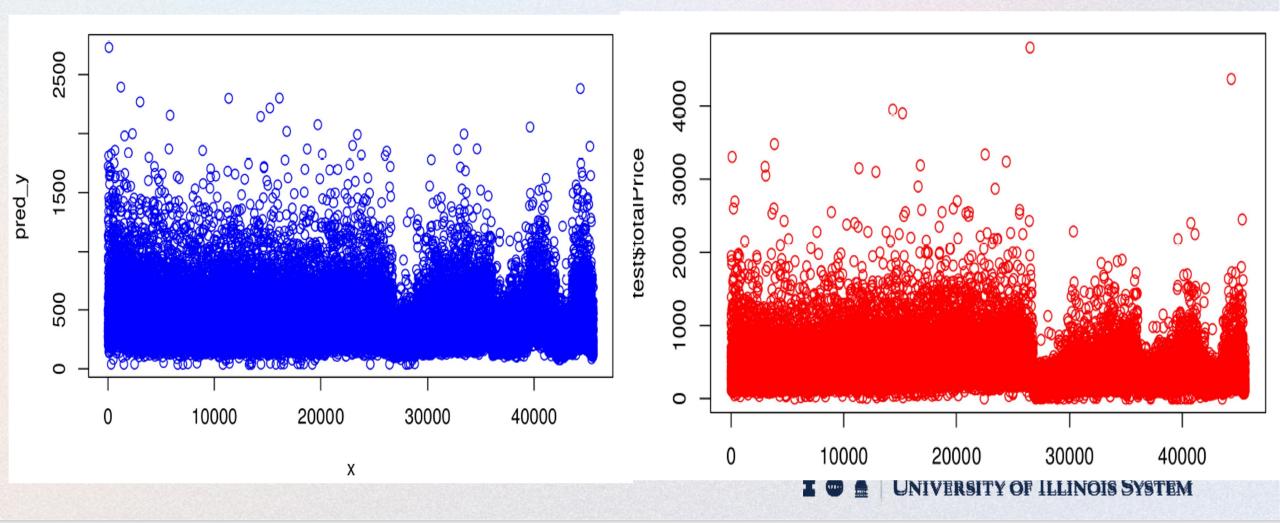

# PREDICTED VS. ACTUAL VALUES (LINEAR REGRESSION)

### **K-Nearest Neighbors**

- KNN regression was done using knnreg function.
- The tuning parameter was the k value.
- The ideal k value, based on the least RMSE value, was found to be k = 8.
- The RMSE for KNN regression is less than linear regression and the R-squared value is also greater for the KNN model.

## PREDICTED VS. ACTUAL VALUES (KNN)

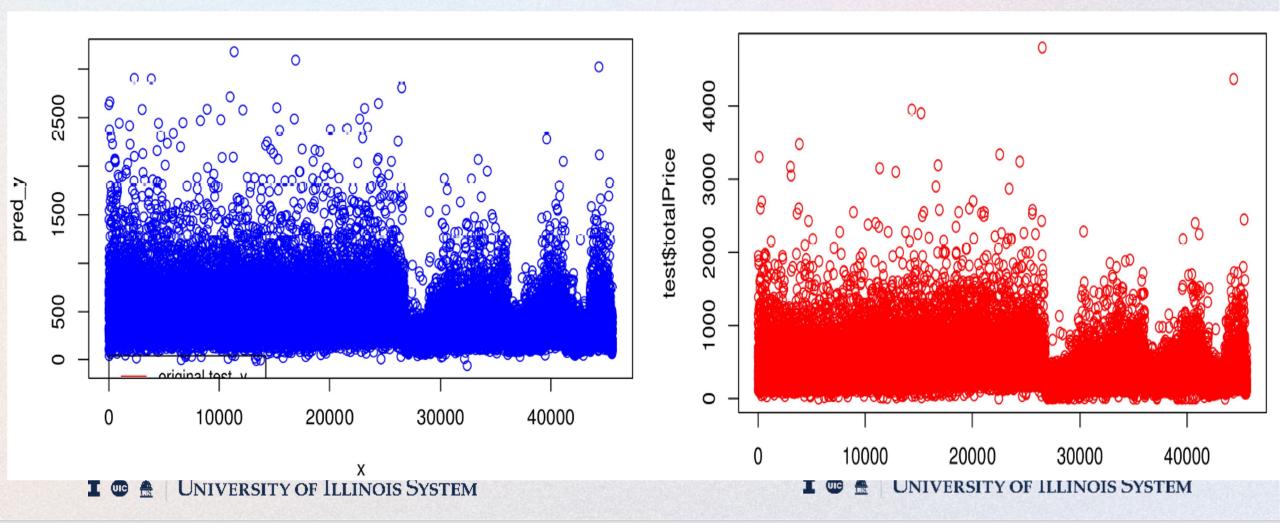

### **Extreme Gradient Boosting**

- Used Caret package to train the model using xgb.train.
- The tuning parameters include "max.depth", "nrounds", and "lambda".
- The ideal values for these parameters were found to be 7; 400 and 3.
- The least values for test-RMSE as well as the train-RMSE were found to be at the 257th round.

## PREDICTED VS. ACTUAL VALUES (XGBOOST)

## COMPARING THE DIFFERENT REGRESSION MODELS

Training RMSE	Testing RMSE	R <sup>2</sup> Value	Tuning Parameters
			N/A
158.076026	157.396601	61.34%	lambda= 0.0083
158.076026	157.396601	61.34%	lambda= 0.0085
121.033	137.8368601	70.67%	k = 8
			max.depth = 7
			nrounds = 400
56.81966	91.91300234	86.95%	lambda = 3
	158.076026 158.076026 158.076026 121.033	158.076026 157.3966963 158.076026 157.396601 158.076026 157.396601 121.033 137.8368601	158.076026 157.3966963 61.34% 158.076026 157.396601 61.34% 158.076026 157.396601 61.34% 121.033 137.8368601 70.67%

## Unsupervised Learning Cluster Analysis

### Purpose / Research Goal

- Group / Identify the data
  - Similar / dissimilar
  - Notable features that share within or distinguish between the groups

- Meaningful trends behind the real estate market
  - Some common beliefs...
  - Association between 'price' and top 10 predictors

### Method / Data Pre-processing / Limitation

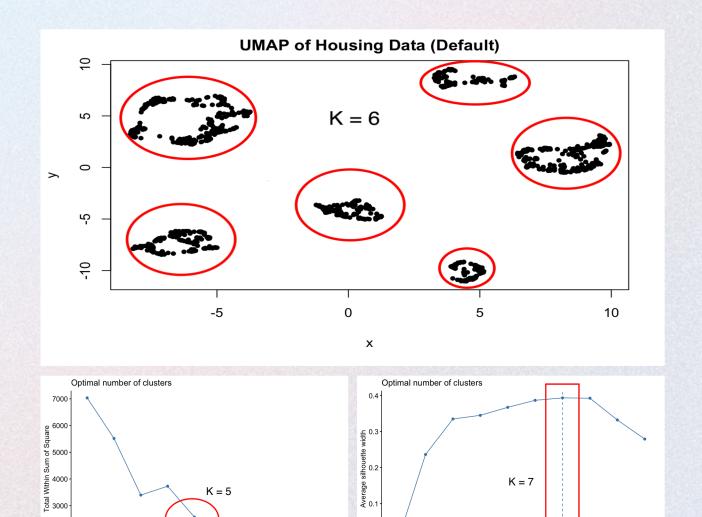

- Method
  - K-Means Clustering
- Data Pre-processing
  - Random sample size of 1000
  - Scaling & Conversion
    - Mean 0 & Standard Deviation 1
    - Gower's distance
      - Convert mixed data (Numeric + Non-numeric) to numeric

- Limitation
  - Representativeness
  - Lack diversity

## Optimal Number of Clusters

- UMAP (Uniform Manifold Approximation and Projection)
  - Dimensionality Reduction
  - Data formation
- Elbow method
  - Minimize within cluster variation
- Silhouette score
  - Cohesiveness within a cluster
     & Separation between
     clusters

>K=6

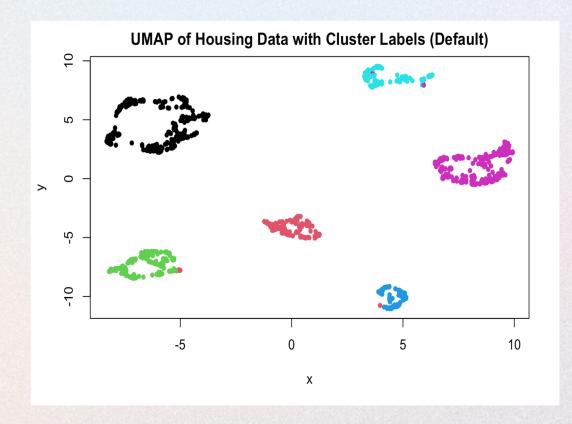

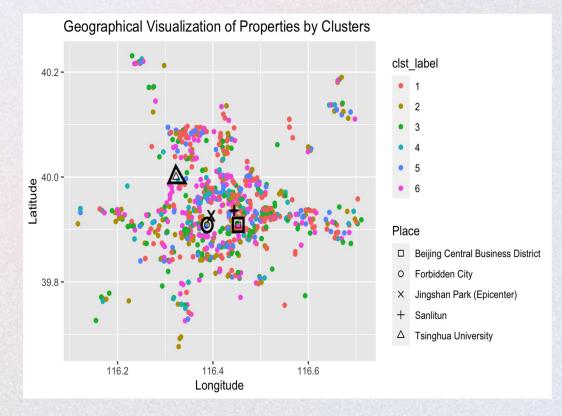

2000

### Cluster Analysis

Match with the groups

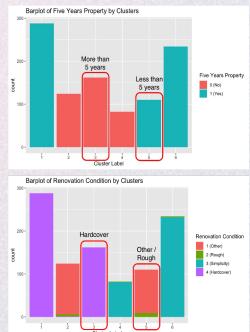

Not meaningful trend based on geographics

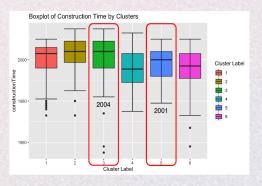

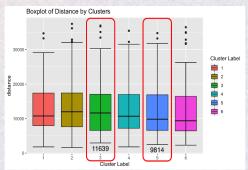

### Cluster Analysis

- Expensive vs Cheap
  - Modern vs Old
  - Hardcover vs Other
  - More than 5 years vs Less
  - High-rise vs Low-medium
- Farther from the epicenter...

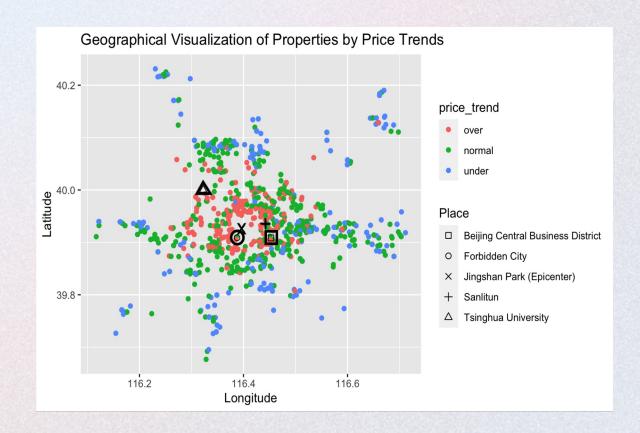

#### **Price Trends**

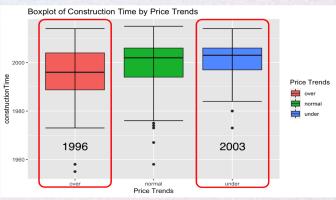

- Trends within a cluster
  - Price less than 25<sup>th</sup> percentile
     (Q1) → Under
  - Price greater than 75<sup>th</sup> percentile (Q3) → Over
  - Price in between the 25<sup>th</sup> and 75<sup>th</sup> percentile → Normal
- Notable 'Price Trend' based on geographic

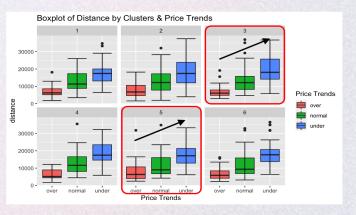

#### Price Trends vs X

- Distance aligning with Price Trends
  - Closer → Over
- Opposite trends
  - Over tends to be...
    - Old
    - Low-Medium stories
- City Planning Viewpoint
  - Center → Outside (Suburb)
  - Old & Low → Modern & High
  - More infrastructures around the epicenter

### **Takeaways**

- Clusters
  - Possible Key factors
    - Construction Time / Renovation Conditions / Five Years Property / Floor #
  - Expensive vs Cheap
    - Modern vs Old / Hardcover vs Other (Rough) / More than 5 years vs Less / High vs Low
- Price Trends
  - Distance
  - Opposite factors : Construction Time / Floor #
  - City Planning Perspective
- Caveats
  - o Data from 2011 to 2017
  - May not reflect current real estate market (e.g. Policy & Regulation)
